

Report
Of
FoodieHub: An Online Food-Ordering Website

Submitted
To
School of Computer Science and Engineering
IILM University, Greater Noida, U.P.

In partial fulfilment of the requirement of degree of
B.Tech CSE

By
Roll Number of Student: 2410030907
Name of Student: ADITYA RAI
Section: 3CSE26
Batch: 2026-27

1. CANDIDATE'S DECLARATION

I, **Aditya Rai**, do hereby declare that the internship report titled "**FoodieHub: An Online Food-Ordering Website**" has been completed by me to fulfil the requirement for the award of the degree of **Bachelor of Technology in CSE**. All the references have been quoted and I have not taken any material from any other source. I affirm that this report is my own and has not been submitted to any other institute for any degree or diploma requirement. I shall be solely responsible for any kind of copyright violation in this regard.

Student Name: Aditya Rai

Roll No.: 2410030907

Section: 3CSE26

2. ACKNOWLEDGEMENT

I am using this opportunity to express my gratitude to everyone who supported me throughout the Internship Program. I am thankful to Navitech Solution Pvt. Ltd. for providing me with the opportunity to undergo summer training. I am sincerely grateful to my guide and the faculty of the School of Computer Science and Engineering, IILM University, Greater Noida, U.P. for their guidance, constructive criticism and support during this work. I also express my gratitude to my parents for their blessings and encouragement.

Signature:

Student Name: Aditya Rai

Roll No.: 2410030907

Section: 3CSE26

4. PROJECT DESCRIPTION

4.1 Introduction

The present internship report describes the design and development of a responsive food-ordering website titled "FoodieHub," created as part of a full-stack web development internship at Naviotech Solution Pvt. Ltd. The internship was undertaken to translate theoretical knowledge gained in coursework into a practical project by building an industry-style e-commerce front end for an online food ordering platform, focusing on clean structure, an appetising visual identity, and a smooth ordering flow. Through this project, the internship aimed to strengthen both technical skills in modern web technologies and professional skills such as planning, structured documentation, and iterative testing.

FoodieHub is a single-page application consisting of five core sections — Home, Menu, About, Contact, and an in-page Cart/Checkout flow — stitched together by a sticky navigation bar that lets a visitor jump smoothly between sections. The Home section establishes the brand identity with a bold heading, "Real food, ordered in seconds," supporting imagery rendered through a warm, food-market colour palette, and a clear call to action, "Order Now," all arranged using CSS Grid and Flexbox to create a balanced, responsive layout. The Menu section presents sixteen dishes across six categories — Pizza, Burgers, Indian, Chinese, Desserts, and Beverages — combining live search and category filtering to help a visitor find a dish quickly.

The Cart and Checkout flow provides a structured interface for reviewing selected items, adjusting quantities, and completing a simulated order, mirroring the core behaviour of a real food-delivery checkout. Each cart line displays the dish name, unit price, running quantity, and line total, with the subtotal, a flat delivery charge, and the grand total recalculated live as the cart changes. Submitting the checkout form generates a unique order number and a confirmation screen, simulating the final step of an ordering system.

From a technical perspective, the project emphasised semantic HTML5 structure, a single external CSS file organised with custom properties (design tokens), Google Fonts integration, hover and focus states, and responsive layout practices down to small mobile screens. Client-side state — specifically the shopping cart — was implemented

in vanilla JavaScript and persisted using the browser's localStorage API, so that a visitor's cart survives a page refresh without any server involvement.

4.2 Organization Profile

Figure 4.5: Navitech Solution Pvt. Ltd. – Company Logo

Navitech Solution Pvt. Ltd. is a leading web development company that specialises in creating innovative and impactful web solutions for businesses of all sizes. Since its establishment, the company has been at the forefront of delivering high-quality websites that are not only visually appealing but also highly functional and user-friendly.

With a team of skilled designers, developers, and digital strategists, Navitech Solution Pvt. Ltd. has built a reputation for crafting customised web experiences that meet the unique requirements and goals of their clients. The company takes a collaborative approach, working closely with clients to understand their vision, target audience, and business objectives in order to create a tailored solution.

Services Provided by Navitech Solution Pvt. Ltd.

- **Website Designing:** A collaborative process, involving close communication between designer and client, that creates the visual and functional elements of a website.
- **Digital Marketing:** An ongoing process of continuous optimisation across online channels that promotes a brand, product, or service.
- **Android App Development:** An iterative process of building functional, user-friendly mobile applications for the Android operating system.
- **Profile Designing:** Creating a visually appealing and informative company profile document that showcases a company's products, services, history and values.
- **Logo Designing:** Creating a simple, memorable visual symbol that represents a company's brand identity.
- **Custom Software Development:** An iterative process of building software tailored to a client's specific business objectives, improving efficiency and accuracy.

4.3 Problem Statement

Traditional food-ordering methods — walking into a restaurant, phoning in an order, or relying entirely on a third-party delivery aggregator — often involve friction: menus are not always easy to browse, orders are prone to miscommunication, and customers have little visibility into what they are about to pay before checkout. For a student learning full-stack web development, these pain points make a food-ordering platform an ideal training ground, since it combines a content-heavy browsing experience (the menu), a stateful interactive component (the cart), and a transactional flow (checkout) — patterns that are foundational to modern web applications.

The problem addressed by this project, therefore, was to design and build a single, self-contained web application that lets a user browse a restaurant's menu, search and filter it, assemble an order in a persistent cart, and complete a checkout — entirely from the browser, without requiring a backend server, a database, or real payment infrastructure, while still feeling like a production-quality product.

4.4 Project Objectives

The objectives of this project were centred around bridging the gap between theoretical coursework and practical implementation, by building a complete, demonstrable web application from scratch. The specific objectives were as follows:

- Gain hands-on experience in building a fully functional food-ordering website using HTML, CSS, and JavaScript.
- Learn to design and implement a responsive, single-page layout with distinct Home, Menu, About, Contact, and Cart/Checkout sections.
- Develop strong problem-solving skills for structuring and styling web pages using modern techniques like CSS Grid, Flexbox, and CSS custom properties.
- Understand how to create and manage interactive user-interface elements such as a live search box, category filters, and a sliding cart drawer.
- Implement client-side application logic in JavaScript, including cart state management and browser storage.
- Develop strong UI/UX sensibilities by designing an engaging, appetite-driven interface suitable for a food-ordering audience.
- Practice cross-browser compatibility and responsiveness to ensure the website looks and works well on desktops, tablets, and mobiles.
- Implement clean, maintainable code following modern frontend standards and best practices.

4.5 Scope of the Project

The scope of the FoodieHub project was intentionally kept to a frontend-only implementation appropriate for a web-development internship of this duration.

- **Included:** a responsive multi-section website (Home, Menu, About, Contact); a searchable and filterable menu of sixteen dishes across six categories; a persistent shopping cart backed by localStorage; and a simulated checkout flow that generates an order confirmation.
- **Excluded:** a real backend server, a database, user authentication or accounts, live payment processing, and order tracking after confirmation — these are identified as future enhancements beyond the scope of the current internship (see Section 4.9).

The project scope was deliberately kept small enough to be completed end-to-end within the four-week internship duration, while still covering the core interaction patterns — browsing, state management, and checkout — found in real e-commerce and food-delivery applications.

4.6 Technologies and Tools Used

- **HTML (HyperText Markup Language):** Serves as the backbone for document structure on the web. In FoodieHub, semantic elements such as `<header>`, `<nav>`, `<section>`, `<form>`, and `<footer>` were used throughout to structure the navbar, menu, cart drawer, and checkout form.
- **CSS (Cascading Style Sheets):** A declarative language dedicated to the separation of content (HTML) from presentation. Flexbox and Grid were used for one-dimensional and two-dimensional layouts respectively, and CSS custom properties defined a reusable design-token system referenced throughout the stylesheet.
- **JavaScript:** A lightweight, event-driven programming language that renders the menu from a data array, filters it by search term and category, manages cart state, persists that state to `localStorage`, and drives the checkout and order-confirmation flow entirely on the client.

Tool / Technology	Purpose
HTML5	Semantic structure for every section of the site
CSS3	Layout (Grid & Flexbox), design tokens, responsive media queries
JavaScript (ES6+)	Menu rendering, search/filter logic, cart state, checkout handling
Browser <code>localStorage</code>	Client-side persistence of the shopping cart
Visual Studio Code	Primary code editor, with Live Server for local preview
Chrome DevTools	Debugging layout, inspecting elements, emulating devices
Google Fonts	Fraunces and Inter typefaces used across the site
Git & GitHub	Version control and hosting of the project source code

Table 4.1: Tools and Technologies Used

4.7 System Architecture

FoodieHub follows a single-page, client-only architecture: there is no server or database, and every interaction is handled inside the browser. The architecture can be described as three cooperating layers:

Layer	Component	Responsibility
Presentation	index.html + style.css	Renders the navbar, hero, menu grid, cart drawer and checkout modal; defines the visual design system.
Application Logic	script.js	Owns the menu data, cart state, search/filter logic and checkout handling; updates the DOM in response to user actions.
Persistence	Browser localStorage	Persists the cart under the key foodiehub_cart so it survives a page refresh, without any server-side storage.

Table 4.2: System Architecture Layers

The interaction pattern follows a straightforward, one-directional flow: a user action (a click, a keystroke, a form submission) triggers a JavaScript event handler, which updates the in-memory application state; the state change is then reflected in the DOM by a render function, and — for the cart specifically — the updated state is written to localStorage so that it persists across page reloads. Because there is no server in this architecture, all business logic (price calculation, search matching, filter matching, order-number generation) executes entirely on the client.

4.8 Methodology

The project was developed iteratively over four weeks, moving component by component — from static structure, to dynamic rendering, to stateful interactivity, to a polished, tested final product — with each week's work verified manually before moving to the next.

Week	Tasks Performed	Technical Focus / Key Deliverables	Tools Used
Week 1	Project kickoff: requirements gathering, site map planning, and file structure setup. Created the HTML skeleton for FoodieHub. Defined the colour palette, typography, and CSS design tokens. Drafted the initial menu data set.	Organised project scaffold; semantic HTML structuring; design-token system established; draft menu dataset ready for rendering.	VS Code, Chrome DevTools, Google Fonts

Week	Tasks Performed	Technical Focus / Key Deliverables	Tools Used
Week 2	Built the sticky navigation bar and hamburger menu, including the cart icon with a live item counter. Designed the hero section with call-to-action buttons. Implemented the category chip bar and menu grid. Wrote the JavaScript render function.	Responsive header and navigation built with Flexbox; dynamic menu rendering from a JavaScript data array; reusable food-card component styled with CSS Grid.	VS Code, Live Server, CSS Grid
Week 3	Implemented live search and category filtering. Built the shopping cart: add-to-cart, quantity control, remove item, automatic total calculation. Connected the cart to localStorage. Styled the sliding cart drawer.	Working search and category-filter logic; cart state management with live total recalculation; persistent cart using the localStorage API.	JavaScript (ES6), Chrome DevTools
Week 4	Built the checkout modal and order-confirmation screen. Added the About and Contact sections. Carried out responsive testing, fixed layout bugs, and wrote the project README and final report.	Functional checkout flow with generated order number; fully responsive layout verified on desktop, tablet and mobile; project documentation compiled.	CSS, Chrome DevTools, Markdown

Table 4.3: Week-by-Week Development Plan

Challenges Encountered and Resolutions

- **Separation of Concerns** — Challenge: keeping structure (HTML), presentation (CSS), and behaviour (JS) modular becomes difficult as a single-page site grows. Resolution: menu data was centralised in one array, rendering functions were kept pure, and DOM lookups were cached once at the top of the script.
- **State Synchronisation** — Challenge: the cart exists in three places at once (in-memory array, on-screen drawer, and localStorage) and can drift out of sync. Resolution: a single renderCart() function was made the only place that reads cart state and updates the DOM, with saveCart() called after every mutation.
- **Layout and Positioning Complexity** — Challenge: choosing between Flexbox and Grid for the navbar, menu grid, and cart drawer required care. Resolution: Flexbox was used for linear arrangements and Grid for two-dimensional layouts, applying each technique to its optimal scenario.
- **Responsive Design** — Challenge: adapting from a wide desktop hero section to a small mobile checkout modal involves fluid grids and multiple breakpoints.

Resolution: CSS Grid's auto-fill/minmax pattern was combined with media queries at three breakpoints, tested using the Chrome DevTools device toolbar.

- **Accessibility** — Challenge: making the cart, search box, and checkout form usable via keyboard and screen reader. Resolution: form fields were paired with `<label>` elements, icon-only buttons were given aria-label attributes, and visible focus states were preserved.

4.9 Expected Outcomes

By the end of the internship, the project was expected to — and did — deliver the following outcomes:

1. HTML5 Mastery

- Developed a deep understanding of semantic elements like `<header>`, `<nav>`, `<main>`, `<section>`, and `<footer>` for better content organisation and SEO.
- Gained experience writing accessible HTML with labelled form fields and aria-label attributes on icon buttons.

2. Advanced CSS Styling and Layouts

- Applied CSS Grid extensively for complex layouts such as the auto-adjusting menu grid.
- Used Flexbox effectively to build a responsive header, cart drawer, and checkout form.
- Integrated external web fonts (Google Fonts — Fraunces and Inter) to maintain a strong brand identity.

3. JavaScript Fundamentals

- Learned event handling for buttons, form submissions, and category chips.
- Developed the ability to manipulate the DOM for dynamic UI changes.
- Implemented client-side data persistence using the localStorage API.

4. Development Workflow, Testing and Project Management

- Gained proficiency with Visual Studio Code and Chrome DevTools for debugging and device emulation.
- Practised version-control basics through Git, preparing the project for a public GitHub repository.
- Verified the layout at desktop, tablet, and mobile breakpoints.
- Created professional documentation, including a project README and this final report.

Conclusion and Suggestions for Future Interns

The internship experience at Naviotech Solution Pvt. Ltd. was transformative in developing practical web-development skills, bridging academic learning with hands-on application. The iterative process of designing, coding, testing, and refining the FoodieHub website provided valuable insight into industry-style tools and workflows. The challenges encountered — from keeping cart state synchronised across the UI and localStorage, to ensuring the layout held up across screen sizes — were instrumental in sharpening problem-solving skills, attention to detail, and adaptability.

The self-driven, deadline-oriented nature of the internship enhanced time-management and documentation skills, preparing a foundation for future professional software-development roles. Based on this experience, the following suggestions are offered for future interns:

- **Solidify Fundamentals:** Master semantic HTML, CSS (Flexbox and Grid), and JavaScript basics before moving to frameworks.
- **Embrace Mobile-First Thinking:** Style for small screens first, then progressively enhance for larger devices.
- **Centralise Application State:** Keep a single source of truth for cart or similar running-total data to avoid synchronisation bugs.
- **Utilise Developer Tools Fully:** Make extensive use of browser DevTools for debugging, inspecting storage, and testing responsiveness.
- **Document Thoroughly:** Keep clear code comments, a project README, and notes on decisions made throughout development.

This internship solidified a practical skill set and the confidence needed to take a project from a blank folder to a complete, demonstrable product — a foundation for future academic projects and for continued growth toward full-stack development roles.

4.10 Certificates of Completion and Other Communication Mail Proof

The following documents provide supporting evidence of the internship completion and its associated communication, in addition to the certificate presented in Chapter 3.
